Mission Voyager-X: Ground Station Recovery Report

Objective: Recover deep-space telemetry from a drifting 2.0 MSps IQ data stream (15 GB) using manual DSP pipelines.

```
from google.colab import drive
drive.mount('/content/drive')
```

```
Drive already mounted at /content/drive; to attempt to forcibly remount, call drive.mount("/content/drive", force_remount=Tr
```

```
# 1. Copy the compressed archive directly from the root of your Drive
!cp "/content/drive/MyDrive/data.tar.zst" /content/

# 2. Install the Zstandard decompression tool
!apt-get update && apt-get install -y zstd

# 3. Create the destination folder
!mkdir -p /content/data_folder

# 4. Extract the .tar.zst file into the data folder
!tar --zstd -xf /content/data.tar.zst -C /content/data_folder/

# 5. Verify the files are there (you should see the chronological text files)
!ls /content/data_folder/ | head -n 5
```

Success! Baseband signal saved to /content/drive/MyDrive/baseband_signal.dat
```

Stage I & II: Signal Detection and Carrier Tracking Challenge: The signal is buried in noise with non-linear frequency drift due to Jupiter's gravity and a degraded onboard oscillator.

Solution: Implemented a Short-Time Fourier Transform (STFT) to map the drift. A frequency-tracking loop was used to shift the signal to baseband, compensating for the Doppler shift.
